

SE Lab 2: Agile Backlog Creation & Sprint Simulation in Jira

Objective: Use Jira to turn functional requirements into Agile backlog items, simulate a sprint, and analyse progress.

Name: Vasu Tripathi

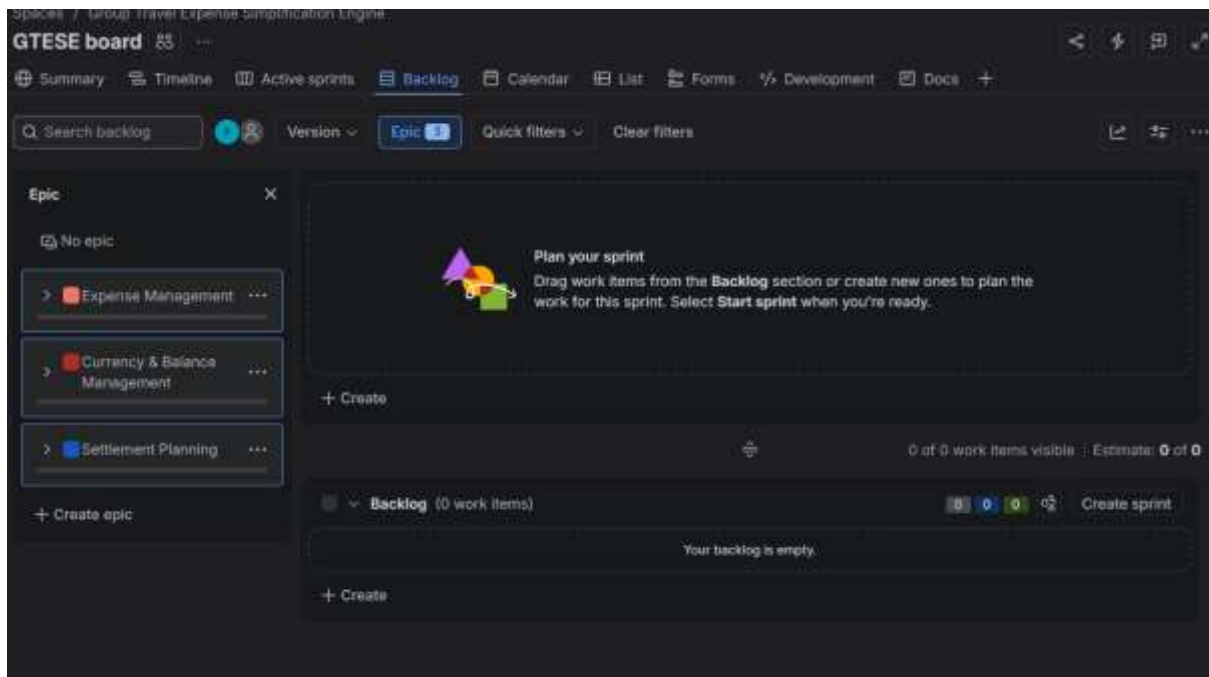

SRN: PES1UG24AM918

Scenario #37

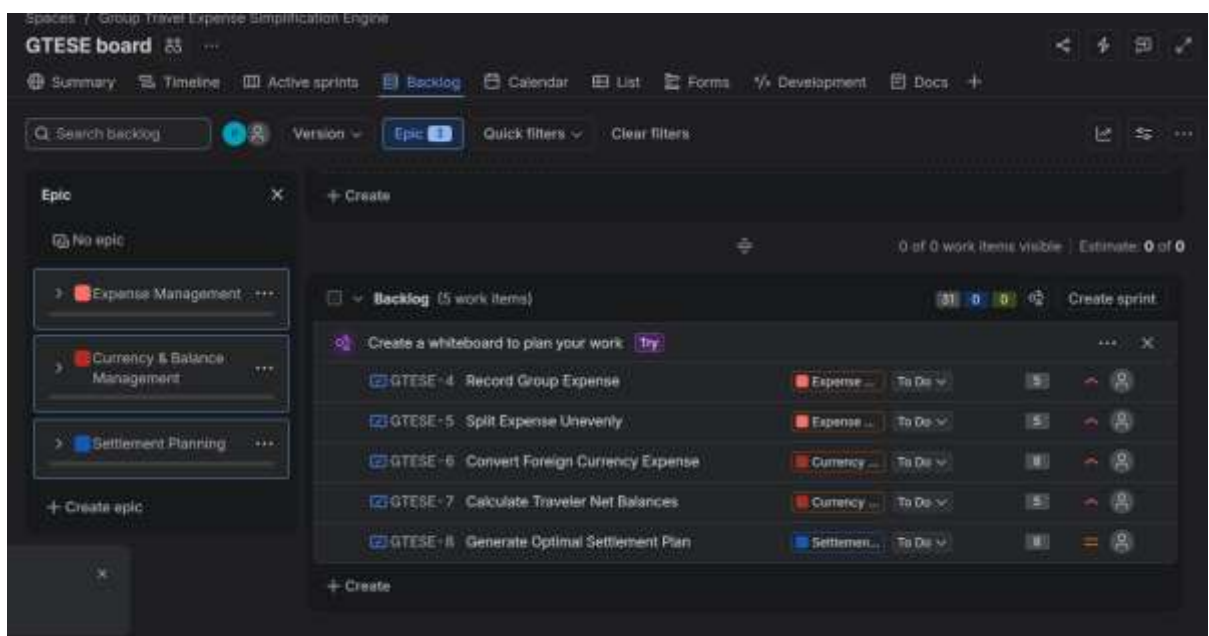

Deliverables:

- Screenshot of:
 - Jira backlog with Epics and User Stories.
 - Story point assignments.
 - Sprint board (Active Sprint view).
 - Burndown Chart.
- A brief document answering the reflection questions.

1. Jira backlog with Epics and User Stories.

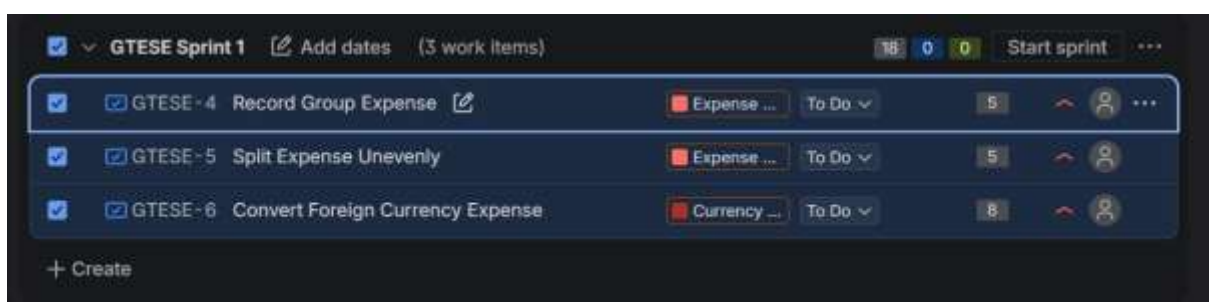

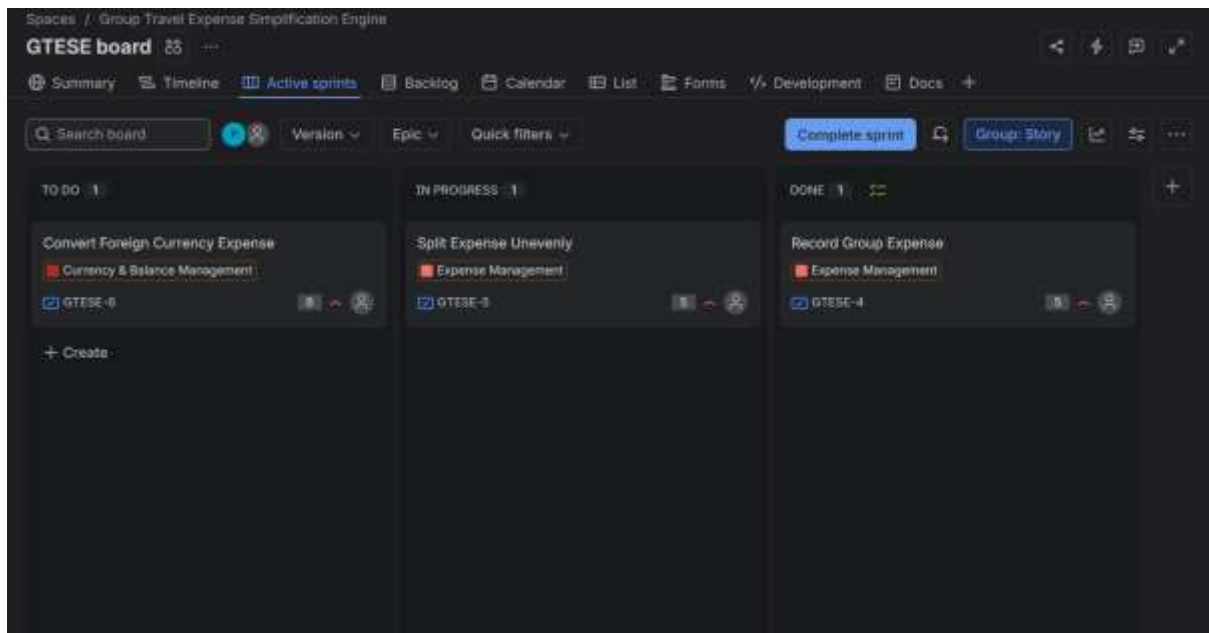

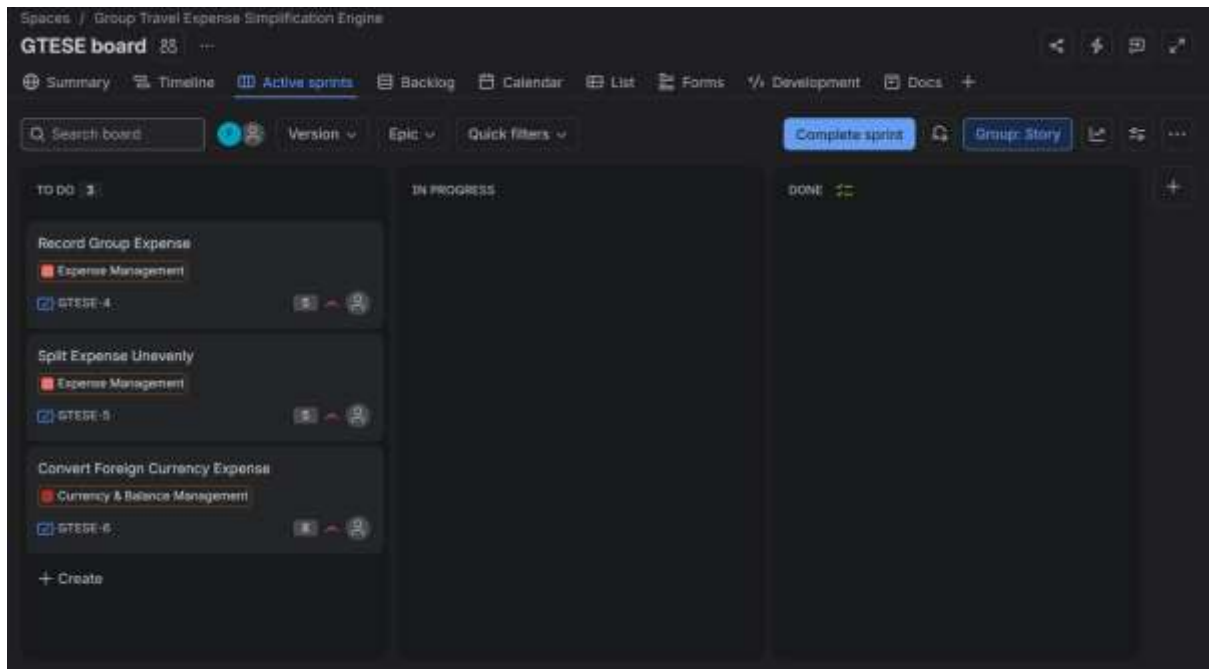

2. Story Point assignments

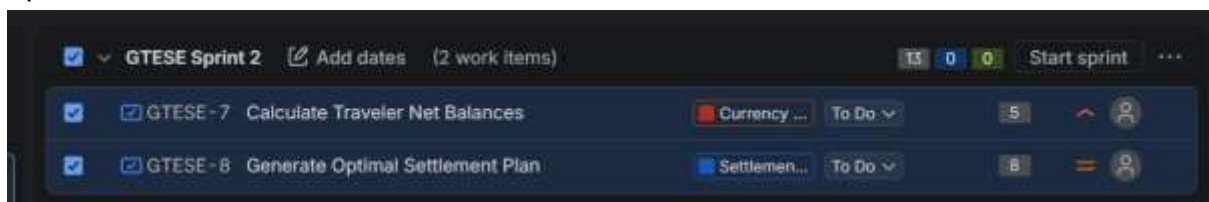

3. Sprint board

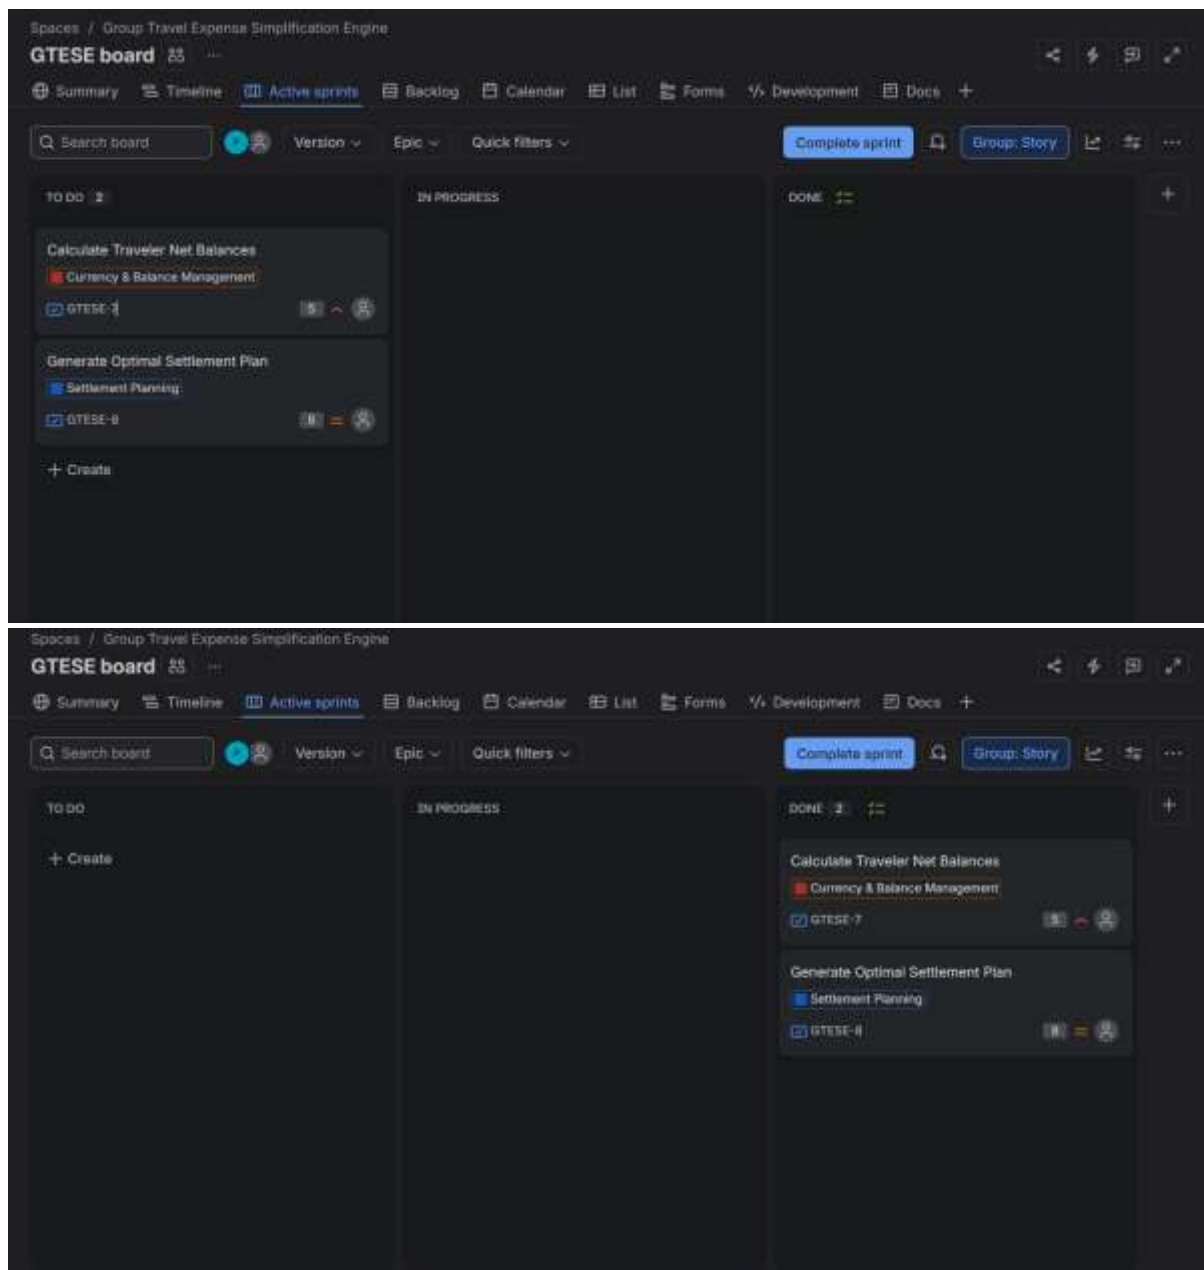

Sprint 1:

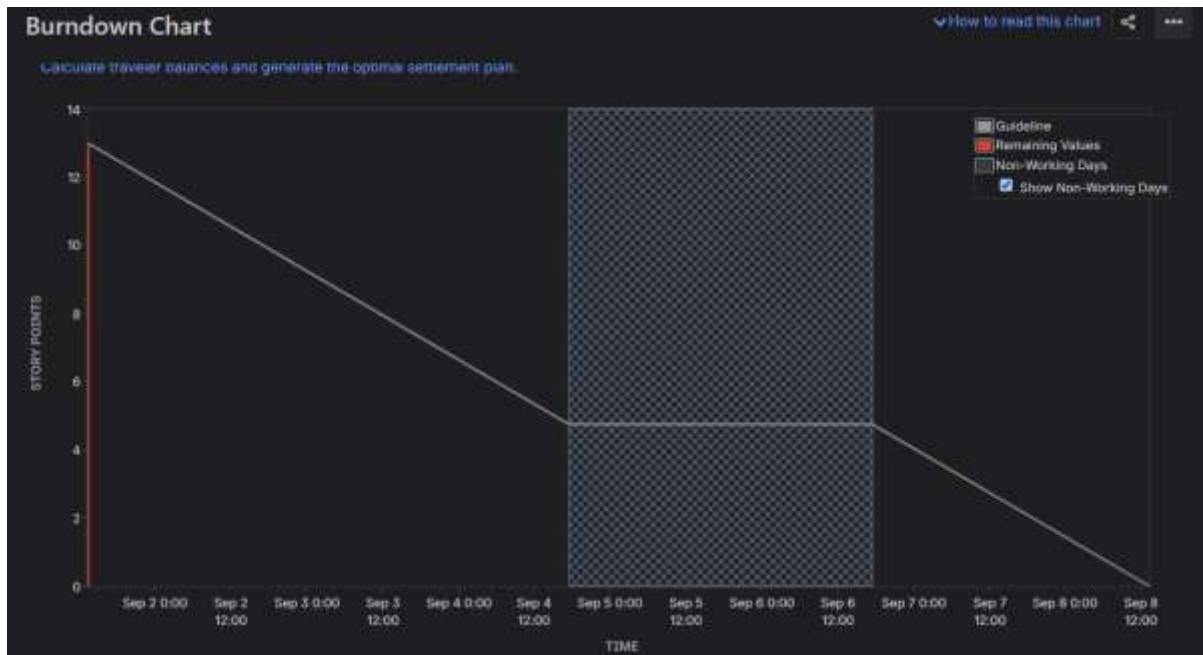

Sprint 2:

4. Burndown chart

7. Reflection

1. Did your estimations reflect the actual effort?

Yes. The story point estimates generally reflected the relative complexity of the tasks. Expense recording and balance calculation were estimated lower, while currency conversion and settlement planning involved greater complexity and uncertainty.

2. Was your backlog well-prioritized?

Yes. The backlog was prioritized according to user impact and system dependencies. Recording and managing expenses were prioritized because accurate expense data is required before balances and settlement plans can be generated.

3. How did your simulated sprint align with your plan?

The simulated sprints followed the planned implementation order. Sprint 1 focused on recording, splitting, and converting expenses, while Sprint 2 focused on calculating balances and generating the final settlement plan.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed how the planned story points decreased during the sprint and provided an indication of the team's ability to complete the planned workload. The simulated Sprint 2 finished with all 13 planned story points completed.
